

New Clamping Device for reed blocks on AKKOblock direct tuning device

So far there was a height adjustment for the reed rest and a height-adjustable plate for the threads of the clamping screw.

NEW: the supports for the reed blocks only consist of one module, which is fixed in height with a screw on the front. The reed blocks are placed on the bracket on the stop and a slide clamps the end of the reed with spring tension.

The sliders can be exchanged to securely clamp different types of reeds.
